Spécialité de Master « Optique, Matière, Paris »

Stage de recherche (4 mois minimum, à partir de début mars)

Proposition de stage

Date de la proposition :

Responsable du stage / *internship supervisor*:

Nom / *name*:	SANCHEZ-PALENCIA	Prénom/ *first name* :	Laurent
Tél :	01 64 53 33 47	Fax : 01 69 33 49 49	
Courriel / *mail*:	lsp@cpht.polytechnique.fr		

Nom du Laboratoire / *laboratory name*: **Center for Theoretical Physics of Ecole Polytechnique**

Code d'identification : UMR7644 Organisme : Ecole Polytechnique and CNRS

Site Internet / *web site*: http://www.uquantmat.fr

Adresse / *address:* route de Saclay, F-91128 Palaiseau

Lieu du stage / *internship place*: Palaiseau

Titre du stage / *internship title*: **Superfluid-Insulator Phase Transitions in Low-Dimensional Ultracold Quantum Gases**

In many-body quantum systems, the interplay of strong interactions and interference drives quantum phase transitions and new emerging ground states at zero temperature. Fascinating examples of quantum phase transitions in condensed matter physics include superfluid-insulator or magnetic transitions [1]. They are particularly spectacular in low dimensional systems because quantum fluctuations and interactions are strongly enhanced compared to their three-dimensional counterparts. An example of which is the Mott transition where an infinitely weak periodic potential in one dimension can change the system from superfluid to insulator [2].

The study of quantum phase transitions is currently attracting enormous interest in connection to the field of ultracold atoms, which offer unprecedented control possibilities. It stimulates the development of *quantum simulators*. Besides experimental developments, the advent of quantum simulators now calls for advanced theoretical work to identify new quantum phase transitions in realistic physical systems. The objective is actually threefold: i) characterize phase transitions, ii) interpret experimental observations, and iii) propose new experiments.

The aim of the internship and thesis is to study theoretically superfluid-insulator transitions in low dimensional systems. In a recent work, we reported the characterization of the Mott transition in a one-dimensional optical lattice in collaboration with an experimental group in Italy [3]. Here, we will extend this study two-dimensional systems and study the effect of more complicated potentials, relevant to present-day experiments. These fundamental issues will be addressed from a theoretical point of view, using the most modern many-body approaches, in particular quantum Monte-Carlo methods. Our code is already developed and uses the most powerful approach, known as the "worm algorithm" [4]. A part of the project may be developed in direct collaborations with experiments.
